**Let's discuss**

## **HOW GREEN MAKES ME SEE RED**

The world needs to tackle pollution slowly and methodically not make it an emotive political vote winning policy. Humanity has built and shaped our society over the last three-thousand years, a period that does not even register on the vast historical timescale. Are we God? It is like reading a horoscope. Who are we to say we can predict a doomsday weather forecast in the next thousand years? We cannot predict in advance a good summer or winter.

Scientists have revealed that historically the world is still coming out of an ice age. There could still be massive cold spells to come. Nature is slowly increasing the temperature and as in the past could decrease it again over several hundred years. Apart from the known ice ages nature is unpredictable over long thousand-year intervals. The Earth has 71% water, and 29% land on its surface and one-third of the land is a desert. Great Britain hardly registers on the land scale. So, yes, control pollution being careful not to plunge many into debt or many of us would have to live in tents using batteries for power and cook with burning wood.

This article is open for a rebuke and hassle for making comments because it does not agree with the strong emotions generated by political leaders. The world travels through many climatic changes in its evolution including ice ages, and tropical ages. Please look at history and see the timescale of the world and its unpredictable weather.
